

Iconic Media Entertainment Enhancement

Creator credit: Inolofatseng Mokgoko

Project: Iconic Media Entertainment

Latest release checkpoint: `c9a1fc2`

Managed production domain: <https://icemediaent-kbysc8ud.manus.space>

GitHub Pages: <https://iconicice.github.io/icynigma-ai/>

Summary

This release extends the faithful Iconic Media Entertainment rebuild with a server-side ElevenLabs voice path for the existing AudioGuide, a browser speech fallback, a responsive avatar studio at `/avatars`, a site-aware Icynigma.ai assistant, and strict SEO/social metadata. The implementation preserves the original dark visual language, animated logo treatment, original navigation, supplied media, media routes, login behavior, and creator credit.

The AudioGuide posts narration text to `/api/tts`. The API key remains server-side, the endpoint bounds input to 5,000 characters, returns `audio/mpeg` bytes on success, and normalizes upstream failures to a safe `502` response. The browser first attempts ElevenLabs playback. If the request or audio playback fails, the component uses `speechSynthesis`; pause, resume, stop, and read-along behavior remain available.

The avatar studio contains eight original generated profile assets in four categories: two dark anime, two alien, two lost astronaut, and two robot/android. Visitors can preview and locally retain a selection. Authenticated users save the validated avatar key to `users.avatarKey` and restore it after login. Quarter rotation is represented by UTC helpers and durable `siteRotation` state; the production Heartbeat `iconic-media-quarterly-avatar-rotation` runs at `0 0 0 1 1,4,7,10 * UTC`.

SEO and social metadata

The root page now uses the document title `Iconic Media Entertainment Studio` (35 characters), six focused meta keywords, an updated description, and complete Open Graph/Twitter card metadata. Regression coverage enforces the strict title and keyword limits.

Implementation map

Area	Implementation
ElevenLabs voice	<code>server/tts.ts</code> , mounted from <code>server/_core/index.ts</code>
Browser fallback	<code>client/src/components/AudioGuide.tsx</code>
Icynigma assistant	<code>client/src/components/ImAssistant.tsx</code>
Avatar catalog	<code>client/src/lib/avatarCatalog.ts</code>
Avatar picker	<code>client/src/pages/Avatars.tsx</code>
Avatar route	<code>/avatars</code> in <code>client/src/App.tsx</code>
Profile persistence	<code>profile.avatar</code> and <code>profile.setAvatar</code> in <code>server/routers.ts</code>
Rotation state	<code>siteRotation</code> table and <code>server/avatarRotation.ts</code>
Scheduled callback	<code>/api/scheduled/avatar-rotation</code>
Tests	Avatar, TTS, AudioGuide, assistant, interaction, and metadata regression tests

Verification

The latest local verification includes a clean TypeScript check, a successful production build, and 18 passing Vitest tests. The managed domain previously returned `200` for `/` and `/avatars` , `400` for invalid `/api/tts` input, and `403` for an unauthenticated direct rotation callback.

Custom-domain status

The intended custom domains are `icynigma.co.za` and `www.icynigma.co.za` . A public DNS check on 2026-10-02 found both names resolving to `157.90.205.139` , with no visible CNAME to `cname.manus.space` ; HTTPS requests failed with `SSL_ERROR_SYSCALL` . The custom domain therefore remains pending registrar/Manus DNS binding and certificate

provisioning. The managed `*.manus.space` deployment and GitHub Pages mirror remain available.

Notes for future avatar drops

The current catalog is centralized in `client/src/lib/avatarCatalog.ts`. Future quarterly visual drops should replace or extend the asset URLs in that manifest, update `AVATAR_CATALOG_VERSION`, and preserve the eight-key category contract unless a schema migration is deliberately planned. Existing users retain saved choices; new users receive the quarter-aware default.
